

Counter Hampers

The Counter Hamper System consists of fixed clear acrylic panels 650mm high with moveable spring sections to alleviate possible injury to customers when the fast rising screen is activated. They are installed at critical distances from the rising screen element to further reduce risk of injury during activation.

DESIGN

Counter Hampers are an ergonomically designed system of clear acrylic screens. Developed initially over two years in partnership with the client and professional ergonomists. The brief from the client was to gain EU Health & Safety regulation compliance through aesthetically acceptable design.

FACILITATING PROTECTION

The Counter Hamper System is positioned at critical distances from the rising screen element. Should it be activated whilst transactions are being carried out at one of however many till positions the public are protected from it.

The Counter Hamper System also slows any would-be assailant from vaulting the counter and attacking staff before the activation of the fast rising screen.

The moveable swing hamper element at each transaction or staff position reduces the possibility of injury to anyone at these positions.

The swing hamper will move with very little force out of the path of limbs. The swing hampers then return with a spring mechanism to their former upright position thus reducing the likelihood of injury.

OTHER BENEFITS

An added bonus is that whilst the Hamper System's primary function is to protect the public from injury, they also provide a deterrent to would-be assailants.

Counter Hampers also have a side arm of clear acrylic shaped and fitted to the counter extensions thus enhancing customer privacy whilst carrying out transactions.

This feature also provides extra stability to the line of Counter Hampers.
